

# IT connectivity of subsidiaries

COST-EFFECTIVE | COMPACT | ROBUST

Compact & cost-effective

## THE filia® SOLUTION

The integration of all required components into a single unit eliminates the requirement for any other hardware for connectivity with subsidiaries. The easily wall-mounted, compact units do away with bulky and expensive racks altogether, enabling better use of limited space.

Technological progress has made it possible to integrate all required functionalities into a single, compact unit. The filia® range can have the following built-in functionalities:

- server
- router
- switches
- uninterruptible power supply (UPS)

### **filia® servers are applicable to various industries**

- Fashion outlets
- Watch and jewellery retailers
- Optician chains
- Gastronomy
- Car dealers (as a dealer management system)
- Supermarket subsidiaries
- Pharmacies

### **Your benefits**

- Space-saving integration of your IT in subsidiaries, eliminating expensive server racks
- Freeing up critical space, optimizing it for sales purposes
- Flexible mounting options
- Easier service
- Stable, long-term available hardware
- High reliability, even in dusty, hot environments

Solutions from a single source

## filia® ADVANTAGES FOR MANAGEMENT

### Remote management – IPMI

Pyramid provides remote management to the server through IPMI 2.0+, which allows the system status to be detected or the unit turned off/on remotely, through a separate interface. The built-in KVM-over-IP feature allows remote KVM from boot screen to full system functionality. Virtual and local drives can be integrated for BIOS or firmware updates, or even for a complete OS installation.

The crux: everything is completely OS independent. No additional software is installed on the server that can be managed over a separate, dedicated management network. Clients require only a browser and Java.

### Zeroconf technology

Replacing a filia® server could not be easier: it requires no technician or configuration due to zeroconf. Simply pull out the SD card from the previous server, plug it into the new one, and you're done!

A replacement unit is immediately sent by express shipment once a defective unit is reported. The customer merely plugs the old SD card with all configuration settings into the replacement unit and the system's up and running as usual, in no time at all.

- A single system restore function throughout the filia® range
- Backs up critical information such as licences or login data
- Eliminates time-consuming service calls
- Reduces service costs
- Minimizes downtime
